Hi,

here at my company we try to have our VE's stored on our NAS. I tried to set this up for on of the VE's and it partially works.

But the big problem is: Networking does not work, and syslogd hangs-up while starting.

I have configured an export like the following:

/mnt/srv/data/servers/imr-install

192.168.25.101(rw,no_all_squash,no_root_squash,subtree_check)

Mounted this directory directly as the private directory (it does contain a full backup of the ve copied there via cp -paR.

mount output looks like this:

192.168.25.2:/mnt/srv/data/servers/imr-install on /var/lib/vz/private/2511 type nfs
(rw,addr=192.168.25.2)

DISK_QUOTA is set to no in the configuration file.

Version information:

System: Debian Etch

Kernel: linux-image-2.6.18-openvz-686 028.18-2.6.18-11-1

Linux kernel binary image for

version 2.6.18 (precompiled kernel from openvz.org)

vzctl: version 3.0.13

There are no log messages in any logfile as far as i can see.

Anybody any idea whats going wrong here?

Thanks in advance

Best Regards

Hello, I can see that, bug http://bugzilla.openvz.org/show_bug.cgi?id=456 is still opened. So, I guess, this is a known problem. You can add yourself to CC list for this BUG and will receive information about progress on this bug.

Thank you,
Vasily.
