Hi,

I have problem with gdb debugging of threaded applications inside OpenVZ environment. Not only in virtual hosts, but on the hardware host also.

It looks like gdb immediately have losing the pids of the threads.

I have added bug into OpenVZ bugzilla, see

http://bugzilla.openvz.org/show_bug.cgi?id=487

I'd like to ask for explanation, what is happening with threaded applications in OpenVZ? Is there some expectation or estimation, how difficult to fix that?
