Hi folks,

I'm currently trying latest 028stab023 (just grabbed it from the web today) and get lots of build errors. Seems like each combination of options brings other errors ;-o  
At least building an patched kernel w/o openvz at all is currently impossible ...

Here's a little start:

```
include/linux/vsched.h:25: error: syntax error before "int"
```

This might come from the #define in sched.h, when CONFIG\_SCHED\_VCPU is not enabled, which aliases vcpu\_online(cpu) to cpu\_online(cpu).

Maybe should just leave off "(cpu)" ?

... I'll have a try ...

cu

Enrico,

please make sure all OpenVZ related kernel config options are enabled:  
[http://wiki.openvz.org/Kernel\\_configuration](http://wiki.openvz.org/Kernel_configuration)

we have not fixed all the option combinations in 2.6.18 yet... :/

Thanks,  
Kirill
