I have a centos-4-i386-minimal installed at ID 101

When I try to run vzyum I get:

```
root@server [/]# vzyum 101 update
ERROR: No such OS template: update
```

Did I miss something?

First, the name of template printed in error message is invalid. It should be "ERROR: No such OS template: centos-4-i386-minimal"

Second, it looks like you do not have metadata for centos-4-i386 installed. Get the rpm from <http://download.openvz.org/template/metadata/centos-4/> and install using rpm -ihv.

I am running OpenVZ on RHEL 3

If I try to install the vztmpl-centos-4-2.0-2.i386.rpm, I get a few dependency errors:

warning: vztmpl-centos-4-2.0-2.i386.rpm: V3 DSA signature: NOKEY, key ID a7a1d4b6

error: Failed dependencies:

 vzpkg >= 2.7.0-18 is needed by vztmpl-centos-4-2.0-2

 vzrpm43 is needed by vztmpl-centos-4-2.0-2

 vzrpm43-python is needed by vztmpl-centos-4-2.0-2

That is right - you need to have all that stuff installed in order to update your VPS from the host system.

Alternative solution is to install yum inside a VPS and run yum update from within that VPS.

That's what I ended up doing..

Inside the VPS I did

```
wget http://mirrors.jtlnet.com/centos/4/apt/i386/RPMS.os/python-s qlite-1.1.6-1.i386.rpm
wget http://mirrors.jtlnet.com/centos/4/apt/i386/RPMS.os/python-e lementtree-1.2.6-4.i386.rpm
wget http://mirrors.jtlnet.com/centos/4/apt/i386/RPMS.os/python-u rlgrabber-2.9.6-2.noarch.rpm
wget http://mirrors.jtlnet.com/centos/4/apt/i386/RPMS.os/centos-y umconf-4-4.3.noarch.rpm
wget http://mirrors.jtlnet.com/centos/4/apt/i386/RPMS.os/yum-2.4. 0-1.centos4.noarch.rpm
wget http://mirrors.jtlnet.com/centos/4/apt/i386/RPMS.os/sqlite-3 .2.2-1.i386.rpm
wget http://mirrors.jtlnet.com/centos/4/apt/i386/RPMS.os/libxml2- python-2.6.16-6.i386.rpm
wget http://mirrors.jtlnet.com/centos/4/apt/i386/RPMS.os/rpm-pyth on-4.3.3-11_nonptl.i386.rpm
```

```
rpm -Uvh *rpm
```

and yum is working perfectly inside the VPS..

Thanks for the help!

I get this error:

```
root@hera:/usr/src# vzyum 1000 update
exec /usr/share/vzyum/bin/yum -c /vz/template/fedora-core/4/i386/config/yum.conf --installroot
/vz/root/1000 --vps=1000 update
There was a problem importing one of the Python modules
required to run yum. The error leading to this problem was:
```

```
No module named cElementTree
```

Please install a package which provides this module, or
verify that the module is installed correctly.

It's possible that the above module doesn't match the
current version of Python, which is:

2.4.1 (#1, Apr 10 2005, 22:30:36)
[GCC 3.3.5]

If you cannot solve this problem yourself, please send this message to <yum@lists.linux.duke.edu>.

I know just about nothing about Python. The VPS 1000 is just a fresh new VPS made from the OpenVZ stock Fedora Core 4.

<https://lists.dulug.duke.edu/pipermail/yum/2005-September/007567.html>

From that URL:

Quote:As the error message indicates, you probably don't have the python-elementtree package installed. What does "rpm -q python-elementtree" show?

If python-elementtree is installed, try installing Yum from source RPM. That seems to work better for most people. Instructions have been posted (probably more than once) to this list. See the list archives.

If you don't use RPMs, get the source for ElementTree from <http://effbot.org/zone/element-index.htm>. I used elementtree-1.2.6-20050316.tar.gz. To install it, run: "python setup.py install" from the extracted elementtree-1.2.6-20050316 directory.

You will also need cElementTree, which is from <http://effbot.org/zone/celementtree.htm>. I used cElementTree-1.0.5-20051216.tar.gz. To install it, run: "python setup.py install" from the extracted cElementTree-1.0.5-20051216 directory.

.. Of course then it complains about "urlgrabber".

I got urlgrabber from http://ftp.debian.org/debian/pool/main/u/urlgrabber/urlgrabber_2.9.7.orig.tar.gz and installed it the same way as ElementTree.

Now it seems to work just fine!
