The new 022stab064.1 source patch (against vanilla 2.6.8 kernel) seems to cause "check_stack_overflow" in irq.c line 145.

When using the .config from my previous *working* OpenVZ kernel, it gets that error. When starting a .config from scratch, it also fails. I've set and unset and reset every single option in the menuconfig and it's still failed with the same error. But using the previous patch instead works just fine.

The exact error I get is:

arch/i386/kernel/irq.c:145: error: conflicting types for `check_stack_overflow`
include/linux/irq.h:80: error: previous declaration of `check_stack_overflow`
arch/i386/kernel/irq.c: In function `do_IRQ`:
arch/i386/kernel/irq.c:506: error: too few arguments to function `check_stack_overflow`
make[1]: *** [arch/i386/kernel/irq.o] Error 1
make: *** [arch/i386/kernel] Error 2

My environment:

AMD Athlon XP 2800+
1GB RAM
Slackware 10.2 (completely fresh install)
No use of X-Windows or any of that graphical nonsense.
Sitting directly in front of the box, direct physical console access
Currently running kernel is the stock Slackware "bare.i" kernel.

Thanks for reporting this!

Can you please file a kernel bug to http://bugzilla.openvz.org/? Do not forget to attach your

original .config.

How did you obtain a fix for this issue? I am getting it here trying to use vanilla kernel + path on fedora core 4...

Thanks!
