Subject: New OpenVZ Web Based Control Panel  
Posted by [rsaylor](#) on Sun, 29 Jan 2006 04:34:56 GMT  
[View Forum Message](#) <> [Reply to Message](#)

---

Hi, I have developed a fully functional web based control panel to administrate the backend of OpenVZ. The program will be listed under GNU and should be starting the 1st downloads soon. I am waiting for OpenVZ blessing 1st before I officially offer the download link. In the mean time, here are some screen shots.

<< EDIT >>

Ok, happy downloading!

Requirements:

- \* Apache 1.3.34
- \* PHP 4.4.2
- \* gcc

How to install Apache + PHP follow this link:  
<http://www.lamphowto.com/lamp.htm>

Download OpenVZ Control Panel follow this link:  
<http://scripts.blurstorm.com/index.php?id=downloads>

<< /EDIT >>

Once we start downloading, I welcome feedback and bug reports as well as other programmers (php mainly) who want to make this better. More will be talked about this once OpenVZ blesses the program.

Robert

I would like to request the owner of OpenVZ to contact me at [robert@blurstorm.com](mailto:robert@blurstorm.com) so I may send you the source files for the program listed in this thread. I sent an email to the mystory email but not sure who that actually goes to.

Thanks, correcting a few items and adding some small other features. I forgot about the different templates so that won't be hard to add. Other then that, I will probally post the download Thursday. Just also wanted to give OpenVZ time to respond because I want them to support this 3rd party software or more like bless it.

Thanks,

I will release it soon for downloading. Also, I want to make some test cases so looking specifically for people who are running x86\_64 linux. I know it works fine in 32 bit.

Also, I will need test cases for the following OS installed on the hardware node once released:

Fedora (version)  
CentOS 4 (works)  
FreeBSD  
RHEL 3  
RHEL 4  
CentOS 4 x86\_64  
RHEL 4 x86\_64  
RHEL 3 x86\_64

Any other main hardware node OS? Anyhow, if people running these could update the post that was once it is released I can get some status back a week or so later for you to test.

Thank you !!!!!  
i been try the scrip the page look ok  
but vps don't create or  
is back to same page

=====

1. Edit /etc/sudousers ( no exist )
2. Add the following:

```
root ALL=(ALL) NOPASSWD: ALL  
nobody ALL=(ALL) NOPASSWD: ALL
```

NOTE: SECURITY NOTE: The VPS Node is designed not to run any users. DO NOT USE THIS SOFTWARE if you have users running on your VPS NODE! This is a potential security hazard IF you have users on the hardware node.

3. Edit settings.php and change the path to vzctl and the path to where the php scripts are installed.

4. chmod 777 ip-database.txt

5. Edit .htaccess and create your password file  
>> .htpasswd -c /.htpasswd username

6. Visit the URL to where you installed the program and enjoy.

please help i am last step ! my life !!  
regards you are the best god blees you !

Create VPS:

If no errors, Linux OS was just created

Set VPSID 151 onboot = yes

Added 192.168.1.222 to VPSID 151

Added hostname localhost.com to VPSID 151

Set root password as demo for VPSID 151

I just started VPSID 151, you should now be able to shell into 192.168.1.222 using user root and password demo

but vps not create  
i check vzlist --all  
not show

=====

note php.ini change << great tips >>  
please help me to run the Great control panel >>>  
god bless you !!!!!!!

yes i been service httpd restart  
after fill the information  
Create VPS:

If no errors, Linux OS was just created

Set VPSID 111 onboot = yes

Added 192.111.111.232 to VPSID 111

Added hostname 1111.com to VPSID 111

Set root password as admin for VPSID 111

I just started VPSID 111, you should now be able to shell into 192.111.111.232 using user root  
and password admin

i check bash command

vzlist --all

no vps found

and i create manual

like

vzctl create 101 --ostemplate centos4 \*\*\*\*\* is work ok

or fedora ok

another tip to check

god bless you !!!

Not to sound like an ass, but if you can't figure out the common things the scripts are doing, much less configure sudo, you don't need to be running them

i doubt he released this to be bottle feeding people wanting to us it.

find you a howto on SUDO and fix that, as thats the problem.

Hi, it appears you do not have a complete install on your server.

I executed one of the php scripts from shell and received the following errors:

No log handling enabled - turning on stderr logging  
Cannot find module (IP-MIB): At line 0 in (none)  
Cannot find module (IF-MIB): At line 0 in (none)  
Cannot find module (TCP-MIB): At line 0 in (none)  
Cannot find module (UDP-MIB): At line 0 in (none)  
Cannot find module (HOST-RESOURCES-MIB): At line 0 in (none)  
Cannot find module (SNMPv2-MIB): At line 0 in (none)  
Cannot find module (SNMPv2-SMI): At line 0 in (none)  
Cannot find module (NOTIFICATION-LOG-MIB): At line 0 in (none)  
Cannot find module (UCD-SNMP-MIB): At line 0 in (none)  
Cannot find module (UCD-DEMO-MIB): At line 0 in (none)

Cannot find module (NET-SNMP-AGENT-MIB): At line 0 in (none)  
Cannot find module (HOST-RESOURCES-TYPES): At line 0 in (none)  
Cannot find module (LM-SENSORS-MIB): At line 0 in (none)  
Cannot find module (IPV6-ICMP-MIB): At line 0 in (none)  
Cannot find module (IPV6-MIB): At line 0 in (none)  
Cannot find module (IPV6-TCP-MIB): At line 0 in (none)  
Cannot find module (IPV6-UDP-MIB): At line 0 in (none)  
Cannot find module (SNMP-VIEW-BASED-ACM-MIB): At line 0 in (none)  
Cannot find module (SNMP-COMMUNITY-MIB): At line 0 in (none)  
Cannot find module (UCD-DLMOD-MIB): At line 0 in (none)  
Cannot find module (SNMP-FRAMEWORK-MIB): At line 0 in (none)  
Cannot find module (SNMP-MPD-MIB): At line 0 in (none)  
Cannot find module (SNMP-USER-BASED-SM-MIB): At line 0 in (none)  
Cannot find module (SNMP-NOTIFICATION-MIB): At line 0 in (none)  
Cannot find module (SNMPv2-TM): At line 0 in (none)

I did the same from several other machines and produced no errors.

My suggestion is for you to do a standard server install for the hardware node using CentOS 4.2

I can not further investigate this unless multiple people are seeing this but I do not think that is the case.

What version you run the script?  
Or OpenVZ Kernel  
My system RUN centos 4.2 Minimal install  
php\* httpd\*

All Vz packets

vz command work ok  
vzctl create delete  
What you recommend to test your script  
I been try all

OpenVZ users please try install this script  
And report success install ASAP

The kernel does not matter with the problem you are having. There are modules missing from your server. Please do a server install (not min) of CentOS 4.2 then report back.

what version of apache are you running? I was thinking this could be a apache 2 issue. I am running 1.34xxx or whatever the 1.x latest version is. I am also upgrading the kernel now on another VPS server I admin that is not in production right now and will post my results shortly. This server I installed from hand using standard CentOS 4.2 server.

Ok, I set this up on another server using the latest kernel and it works fine.

This is not a control panel issue, I think it could be the level of apache you are running.

vps  
Create VPS:

If no errors, Linux OS was just created

Set VPSID 1212 onboot = yes

Added 192.168.1.129 to VPSID 1212

Added hostname 1111.com to VPSID 1212

Set root password as admin ID 1212

I just started VPSID 1212, you should now be able to shell into 192.168.1.129 using user root and password admin  
but not create any vps  
i run apache 1.3

Help!!

Dear this good Manual ? for php install

1. `gunzip -c apache_1.3.x.tar.gz | tar xf -`
2. `cd apache_1.3.x`
3. `./configure`
4. `cd ..`
  
5. `gunzip -c php-5.x.y.tar.gz | tar xf -`
6. `cd php-5.x.y`
7. `./configure --with-mysql --with-apache=../apache_1.3.x`
8. `make`
9. `make install`

10. `cd ../apache_1.3.x`

11. `./configure --prefix=/www --activate-module=src/modules/php5/libphp5.a`  
(The above line is correct! Yes, we know libphp5.a does not exist at this stage. It isn't supposed to. It will be created.)

12. `make`

(you should now have an httpd binary which you can copy to your Apache bin dir if it is your first install then you need to "make install" as well)

13. `cd ../php-5.x.y`

14. `cp php.ini-dist /usr/local/lib/php.ini`

15. You can edit `/usr/local/lib/php.ini` file to set PHP options.

Edit your `httpd.conf` or `srm.conf` file and add:

`AddType application/x-httpd-php .php`

that is not how the link I posted talks about installing apache and php. You need to install php 4, not 5. Please follow the directions.

Cool Panel. May want to check out blind sudo/php globals. Other than that, good work. Thx for helping the community out.

Rick

well, yes it is in-secure but with these conditions it does not pose a threat to me.

1. There are no users on the hardware node
2. The Control Panel is protected with a `htpasswd`
3. Everything operates inside the `htpasswd` directory

Of course, with later releases these security issues will be talked more and dealt with using other means.

Dear Rober your are the Best Number One  
the panel work great  
Require  
APACHE 1.3.34  
PHP 4 (I USE version 5 is working )  
Great Panel A+++++ 100%

for everyone who cant sudo;  
  
add a line to your /etc/sudoers;  
apache ALL=(ALL) NOPASSWD:ALL  
  
where "apache" is owner of your httpd processes.

Just a note this project is dead. There are a lot of good ones out there. Just getting back into the VPS world, might assist in making one of the free ones a little better in the upcoming months.
