
Subject: Fedora Core 6 ready to use template?

Hello,

one of my users asked me for VE with Fedora Core 6 installed. It is't part of precreated packages:

<http://download.openvz.org/template/precreated/>

Is precreated template of this system somewhere else?

Thanks

Hello,

There is no precreated template cache for FC6 at the moment at openvz.org. Probably somebody from OpenVZ users has created it, but I haven't heard about it.

I guess, you can install FC5 precreated template cache, create a VE based on this template, then upgrade VE up to FC6 from inside VE using usual means (up2date, yum). After that clean VE from needless information (network settings, users, ...) and create a tar.gz archive of VE - it'll be a template cache for FC6.

HTH,
Vasily

I was able to replicate the `vz/template/fedora/5` directory over to
`vz/template/fedora/6` and then modify the `.../i386/conf/yum.conf` file
appropriately (just change all the instances of 5 to 6). I was then
able to use `vzcachepkg` to create and manage the templates. I've got
several VE's running based on that template now. It would be nice if
someone could package this up and add it to the template repositories.
This one is not to terribly hard to create.

OTOH... I've just been working with CentOS 5. It's a friggen
nightmare. There's a "conflicts with kernel < 2.6.12" built into the
`initscripts` rpm that's hosing everything and I've been totally unable to
build a centos-5 template. Even adding the kernel package to the
package lists doesn't help (is it excluded somewhere, somehow).

Even updating from CentOS 4 to CentOS 5 isn't working. The conflict
exists if it doesn't find a kernel package it likes (in this case it
doesn't even exist). You can install the kernel package (which can be
removed later, if you care) and then `vzyum` will update a bunch of
packages, including `initscripts`, and update even more when you run a
final `vzyum` update after the `vzyum` install. But the resulting VE is non
functional. Trying to enter the running VE, I get a "Unable to open
pty: No such file or directory". No joy either way.

Really strange, since they've got an RHEL 5 kernel on the OpenVZ site.
No templates for VE's, though. If CentOS 5 won't build into a template,

I would guess RHEL 5 is going to be the same trouble.

CentOS 5 was just released yesterday and the OpenVZ team doesn't even have an FC6 template in the repositories yet, so I'm not holding my breath.

I think both FC6 and CentOS5 templates will be ready next week.

Thanks,
Kirill

i tried yesterday the same and got centos5 ve under centos5 running.
what i did:

- 1) fetched precreated centos-4-i386-default.tar.gz and installed
 - 2) updated ve to centos 4.4 (yum update)
 - 3) cleaned yum cache, fetched from centos5:
 - > centos-release-5-0.0.el5.centos.2.i386.rpm
 - > centos-release-notes-5.0.0-2.i386.rpm
- installed them (see upgrading centos4 to centos5 on [wiki.centos.org](#))

4) tried yum upgrade, which failed because of konflikt of httpd and initscripts

5) fetched initscripts from centos5

-> initscripts-8.45.14.EL-1.el5.centos.1.i386.rpm

and updated them rpm -Fvh --force

initscripts-8.45.14.EL-1.el5.centos.1.i386.rpm

force is needed becaus of complaining wrong kernel

6) yum upgrade

vzctl stop & start,

vzctl enter failed with complaining about missing devices (centos5 is using udev !)

vzctl stop and edited /etc/rc.sysinit, commented out start_udev and copied missing

devices from a default centos4 ve.

i haven't checked if everything else is ok, but primary goal was getting centos 6 with apache, php and mysql vor webserver running.

i will test the ve over the weekend and will report again.

FC6/i686 (precreated only) is now available from

<http://download.openvz.org/template/precreated/fedora-core-6-i686-default.tar.gz>

FC6/x86_64 will follow next week.

CentOS 5 -- we will start working on it next week.

All I can provide now are a few hints. CentOS 5 template will be available in a few weeks or so.

1. Check if /dev is hosted on tmpfs. If yes -- find out where in initscripts /dev is mounted using tmpfs, and get rid of this mount.

2. Try to (forcibly I suppose) remove udev package from the VE, and install back vzdev package.

3. Copy the /dev/tty* and /dev/ptyp* devices from VE0 into VE.

4. Make sure /dev/pts is mounted inside a VE.

5. Check if your kernel is compiled with the following options:

```
CONFIG_UNIX98_PTYS=y  
CONFIG_LEGACY_PTYS=y
```

Hello Kir,

> FC6/i686 (precreated only) is now available from
> <http://download.openvz.org/template/precreated/fedora-core-6-i686-default.tar.gz>

Thank you very much! I already installed FC6 into VMWare, transfered it into OpenVZ and I was fighting with udev and yum. I was beaten first time when I missed that yum is going remove yum and rpm ;) Second try was better but still not very good (I just edited /sbin/start_udev to not start it and provided static /dev).

Maybe you can reconsider some of packages inside, such as lm_sensors. They are not necessary for VE and on other hand I was missing yum inside, I'm not very used to rpm, I'm mainly using Debian. yum is in my option much user-friendly than plain rpm.

Your template is much better than mine attempt. Thanks you very much, your help is very appreciated! Thanks :)
