Hi,

I installed ovzkernel-2.6.18 for debian sarge from
http://debian.systs.org/ on a machine running inside vmware. During installation (apt-get
ovzkernel-2.6.18) I got some warning:
add_modules_dep_2_5: modprobe failed
FATAL: Module sd_mod not found.
WARNING: This failure MAY indicate that your kernel will not boot!
but it can also be triggered by needed modules being compiled into
the kernel.

and indeed it doesn't boot. I did some searching and found that someone had a similar problem,
and solved that problem by recreating initrd using something like
mkinitrd -o /boot/initrd.img-2.6.18-028stab023.1+31-openvz 2.6.18-028stab023.1+31-openvz
so I tried the same but also got the same warning and the kernel doesn't boot either. The vmware
machine has a SCSI disk with the module
mptscsih (Fusion), so I tried to add that module to /etc/mkinitrd/modules and rerun mkinitrd, but
also without success.
Any hints what else I should try please?

Hi,

add_modules_dep_2_5: modprobe failed
> FATAL: Module sd_mod not found.
This kernel driver is built-in not as a module, so this error is only a warning!

> mptscsih (Fusion), so I tried to add that module to /etc/mkinitrd/modules and rerun mkinitrd,

Have you add the module mptbase, mptscsih, depends on mptbase !

Have you add the module mptbase, mptscsih, depends on mptbase !

Hi,

thanks for the hint. I followed that but the result is the same. btw, I forgot to tell more about the kernel panic symptom:

umount: devfs: not mounted
mount:unknown filesystem 'devfs'
umount: devfs: not mounted
pivot_root: No such file or directory
/sbin/init: 424: cannot open dev/console: No such file
Kernel panic: Attempted to kill init!

I was running the 2.6.9 ovz kernel (also from your site) without problem, however it seems that the current recommended version is 2.6.18 so I would like to switch to the new kernel.

I also read somewhere on the web that the initrd-tools in debian may not work for kernels newer than 2.6.12 -- could it be the reason?

Thanks for your time,
Thanh
