yes. we need something like :

```
-       while (!atomic_read(&s->killed)) {
+       while (1) {
            try_to_freeze();

            set_current_state(TASK_INTERRUPTIBLE);

+           if (atomic_read(&s->killed))
+               break;
+
```

I have an old patch for this driver. I'll refresh it.

but we can't just change it, can we ? i could be used by a user space tool
to check if the thread is running.

C.

here's the refreshed version not taking into account the space in its
kernel thread name.

C.

But all kernel threads are supposed to be only *in-kernel*
implementation details. Isn't a userspace tool whose behaviour relies
on the existence (or even the knowledge of the existence) of any
kernel thread *broken by design*?

> > but we can't just change it, can we ? i could be used by a user space tool

Yes, so although userspace shouldn't be bothering with kernel threads
in the first place, that does not mean that such tools do not exist.
So we'll have to live with this (unfortunate) naming for some time,
till we can get rid of it later.

Which is similar to the habit of some kernel threads in there that
actually *do* want to export the knowledge of their existence (and
even a signals-based interface!) to userspace. Eric did receive some
nacks on his patches that tried to remove the signals business from
kernel threads on this account, but perhaps that too is something that
we could get rid of later (hopefully by that time those using signals

in kernel threads would have realized their folly and shifted to
something else :-)
