Hi,

I´ve set up an VE, and when I start it, no errors occurs.
I've given an IP from my eth0:1 to the VE, it starts with it without any problems.
But if I want to access the IP (VE), I come out to my original server root. No VE is accessiable from outer network.

What can I do?

Sorry for my bad english.

Patrick

First, you should enable port forwarding as per http://wiki.openvz.org/Quick_installation#sysctl (i.e. modify /etc/sysctl.conf and then run sysctl -p)

Next, you do not want that IP address to present on your eth interface -- remove it from there.

Hi,

that was it.
I've deleted all additional ip from the interfaces.
Now, it runs.

Thank you
