New OpenVZ kernel is used getting an a boot error
that hangs the boot of "Net:Registered protocol family 16" when
installed
on a CentOS version 4.4 server. Note this server had all updates
installed first prior to OpenVZ kernel install. Is this an issue or is
this a bug of some type as we found an updated tool "Error: 1ksctp_tools
conflicts with kernel >= 2.6.10" had to be removed to even load the
OpenVZ kernel download install at first . Considering reinstall of
CentOS with no updates if this is recommended for normal install of this
kernel? Any feedback appreciated as soon as possible.

which kernel version do you use? please report exact version.

RHEL4-OVZ kernel (which is 2.6.9) is recommended for use with CentOS 4.4.
(http://download.openvz.org/kernel/branches/rhel4-2.6.9/curre nt/)

Thanks,
Kirill

The latest version and then just tired the version you noted below with same error. We are currently rebuilding server and will attempt to install again prior to updates. Any warnings appreciated.

Thanks,
Robert Patten
