Hey,

I've been working on some scripts that make VPS Management easier...

Hopefully I will get them into a web gui eventually but for now I doubt it...

Heres what I've done so far:

File Name: createvps.sh

Usage: ./createvps.sh [VPSID] [OSIMAGE] [CONFIGFILE] [HOSTNAME] [IPADDRESS]
[NAMESERVER] [PASSWORD] [ONBOOT]

Explanation: This is used to create new vps's... it will create a vps and set hostname, ip, nameserver, password and yes/no for start on boot.

That's the main file. I've created a few more:

destroyvps.sh = Destroy VPS with specified ID

restartvps.sh = Restarts VPS with specified ID

stopvps.sh = Halts VPS with specified ID

startvps.sh = Starts VPS with specified ID

listimages.sh = Lists all files in /vz/template/cache

addip.sh = Adds IP to vps with specified ID

I will be making a few more before I release it, but I'm wondering. Do you guys like what I have so far?

Are you interested in this type of thing?

Wow, these forums are barely active!

However, my scripts have been released.

You can download them here: <http://vzspot.com/?p=4>

If you want to read the README before you download them (To get a idea of what they do) click here: <http://www.vzspot.com/downloads/ovz-scripts/README>

From the download page you can download a ZIP archive or a auto installer (Just a serious of WGET's)

These are very nice. Saves people time making scripts like these and I thank you for your time and offering them for others to use.

I was getting an error when trying to use the vpsstatus.sh script.
./vpsstatus.sh: line 1: [: not: unary operator expected

I fixed this by changing some things around in your script. Hope you do not mind.)

Where you have:

```
if [ not $1 ]
```

I changed to:

```
if [ "$1" = "" ];
```
