
Subject: [PATCH 08/10] Containers(V10): Share css_group arrays between tasks with same container memberships

Posted by [Paul Menage](#) on Tue, 29 May 2007 13:01:12 GMT

[View Forum Message](#) <> [Reply to Message](#)

This patch replaces the struct css_group embedded in task_struct with a pointer; all tasks that have the same set of memberships across all hierarchies will share a css_group object, and will be linked via their css_groups field to the "tasks" list_head in the css_group.

Assuming that many tasks share the same container assignments, this reduces overall space usage and keeps the size of the task_struct down (three pointers added to task_struct compared to a non-containers kernel, no matter how many subsystems are registered).

Signed-off-by: Paul Menage <menage@google.com>

@@ -176,7 +176,9 @@ Containers extends the kernel as follows

 subsystem state is something that's expected to happen frequently
 and in performance-critical code, whereas operations that require a
 task's actual container assignments (in particular, moving between

- containers) are less common.

+ containers) are less common. A linked list runs through the cg_list

+ field of each task_struct using the css_group, anchored at

+ css_group->tasks.

- A container hierarchy filesystem can be mounted for browsing and
manipulation from user space.

@@ -252,6 +254,16 @@ linear search to locate an appropriate e
very efficient. A future version will use a hash table for better
performance.

+To allow access from a container to the css_groups (and hence tasks)

+that comprise it, a set of cg_container_link objects form a lattice;

+each cg_container_link is linked into a list of cg_container_links for

+a single container on its cont_link_list field, and a list of

+cg_container_links for a single css_group on its cg_link_list.

+

+Thus the set of tasks in a container can be listed by iterating over

+each css_group that references the container, and sub-iterating over

+each css_group's task set.

+

The use of a Linux virtual file system (vfs) to represent the
container hierarchy provides for a familiar permission and name space
for containers, with a minimum of additional kernel code.
