<http://www.vmware.com/vmtn/appliances/>

So we can share pre-packaged VE with a set of applications...

Ugo

That's a really good idea, we are already thinking of something like it.

Perhaps we will start with a page at wiki.openvz.org where everyone could add description and links to the templates they've created for OpenVZ.

BTW do you have some?

--I am looking at porting my Squid V2 VM to OpenVZ \$soon

--Would really like to see openVZ working UNDER vmware workstation/server, for " teh best of both worlds " scenario.

--After all, vmware creates a virtual Machine -- openvz underneath that would leverage vmware's infrastructure for multiple virtual linux instances on (1) VM, with snapshots, etc supported "out of the box."

--Currently, openvz networking does not work in a vmware vm. (In my experience, using Bridged networking.) If I'm wrong, please correct me.

--If my firm gets \$venture-capital, we are looking at serious vmware Server / ESX deployment. I am also looking seriously at openvz for Linux -> Linux vms as it seems to require MUCH less overhead.

--However, currently openVZ networking is a PITA compared to vmware, where it Just Works. I spent several HOURS recently trying to debug OVZ networking with a Class B and Class A interface (one was veth and one was venet), just trying to get them switched around. Finally I said hellwithit and left it the way it was, which happens to work.

// Not quite ready for production Enterprise use, IMHO.
/// But getting there...

Quote:--Currently, openvz networking does not work in a vmware vm. Sad (In my experience, using Bridged networking.) If I'm wrong, please correct me.

It works! At least I know quite a few people, who are using OpenVZ in VMware with bridged networking.

Vasily.

Hmm, it didn't work under the livecd-environment for me; looks like I'll have to take another look at it.

it just so happens that i actually made one last week.

To download, you'll be prompted for a username/pass
username: openvz
password: openvz

<http://s2.safevps.com/files/safevps.com-fc6-openvz.7z>

the VM's root info: root:root123

the HN is running Fedora Core 6 with the latest updates (as of May 30th 2007). The Openvz VE running inside it is Debian 4.0 - LAMP setup, and i've forwarded port 80 to the VE.
