Hello,

Seems like vzpkgcache is leaving the temporary directories:

ls /vz/private

```
100001 100003 100005 100007 100009
```

```
100002 100004 100006 100008
```

Kernel version:

```
Linux awknet01.myvps.biz 2.6.18-8.1.4.el5.028stab035.1PAE #1 SMP Sat Jun 9 02:27:12 MSD
2007 i686 athlon i386 GNU/Linux
```

Well, seems that's not just leaving the dirs but the vps running

```
[root@awknet01 ~]# vzlist
```

```
Unable to open /etc/vz/conf/100001.conf: No such file or directory
```

```
Unable to open /etc/vz/conf/100002.conf: No such file or directory
```

```
  VEID   NPROC STATUS IP_ADDR  HOSTNAME
100001     1 running   -
100002     1 running   -
```

How do you guys suggest to stop those vps?

vzctl stop xxx don't work since there are 1 process in /vz/lock

Hmm, can you give me ssh access to your hardware node so I can check that's happening?

OK, the problem was bad interoperability of newer kernels and older vzctl which is fixed in vzctl git but not yet released.

Here's the fix:

<http://git.openvz.org/?p=vzctl;a=commitdiff;h=4766d1f711a73e7929530a5a3f50d749e0f9de6a>

If anybody else is having the same problem, there are a few options:

1. Wait for vzctl-3.0.17 to be released (I hope it will happen this week or so).
 2. Use latest vzctl from git repo.
 3. Rebuild vzctl-3.0.16 with the above patch applied (most conservative approach).
