Hello,

I have erro in install in VPS witch centos4 and centos5.

What problem?

```
x12...13...14.....
```

```
.....  
.....  
.....  
.....open3: close(main::RNULL) failed: Bad file descriptor at ./install line  
650
```

```
.open3: close(main::RNULL) failed: Bad file descriptor at ./install line 650
```

```
[root@linux home]#
```

I tested in vps witch centos4 and centos5 ;

1. Did you check /proc/user_beancounters ? If you'll see non-zero values in failcnt column for a VE during cpanel installation, increase appropriate limit value.

For example to increase applications memory limit for VE101 up to 2GB:

```
# vzctl set 101 --privvmpages 2G:2G
```

Additional info:

man vzctl

http://wiki.openvz.org/Proc/user_beancounters

2. If all failcnt are set to 0, can you attach the ./install script?
