During the last few days i had a few issues with some applications using huge ammounts of low memory.

WIKI

Utilization of low memory below 1 is normal. Utilization above 1 is not safe, and utilization above 2 is dangerous is very likely to cause bad system responsiveness, application stalls for seconds or more and termination of some applications.

Please correct me if i'm wrong

Quote:

Output values in Mbytes

LowMem	LowMem	RAM	MemSwap	MemSwap	Alloc	Alloc	Alloc
util	commit	util	util	commit	util	commit	limit
70.10	299.52	1571.81	1571.81	6411.52	3230.23	6411.52	13645.10
327.00	327.00	8050.00	8050.00	8050.00	8050.00	8050.00	8050.00

LOWMEM

Committed » 299.52MB

lowmem*0,4 » 327.00MB

It's safe to use up to 327MB

It's not safe to use more than 327MB

What can happen if the low memory usage went to 450MB (eg.)?

Tks in advance,

Your question is a bit vague to me.

when you say "safe", do you mean safe for your HN, as in overcommitment+overusage by the VE? Or, do you mean overusage from in the VE context vs. the UBC limits?

If the first, paste your user_beancounters as this is a bit easier for me to read.

If the latter, we would need to know how much memory your HN has to say what is safe.

Rick
