Hi,

I would like to know if it would be possible to use ipt_mport and ipt_iplimit inside a VPS or from the node server. Currently I have servers with CentOS 4 and kernel 2.6.18 and 2.6.9 and on none of these I'm able to use either one of the modules mentioned above from the HN nor from inside any VPS. Is there a way to have those modules added to the kernel?

Regards,

Eugenio Pacheco

Hello,

I think "ipt_mport" is multiport matching, is it? If so, you can use it on HN:

iptables -A INPUT -p udp -m multiport --ports 567 -j DROP

"limit" also works on HN:

iptables -A INPUT -p udp -m limit --limit 567/second

multiport and limit also work in VE.

Vasily.

Hi,

Actually mport is different from multiport. On mport you could use port ranges such as

---

80:110,6660:6670... Also iplimit is different from limit, iplimit can limit number of concurent connections without time limit instead of having to use a timeframe.

Regards,

Eugenio Pacheco

Oh!.. Sorry for my ignorance! I'm not a big professional in iptables.

Well, as I know mport extention is not included in vanilla/rhel kernels at the moment, so it isn't supported by OpenVZ kernels also. The same situation is with iplimit extention.

HTH,
Vasily.

Hi,

Thanks a lot, I just wanted to make sure they weren't in the kernel. I will check out wiki as to how to patch a vanilla kernel and add these iptables module.

Regards,

Eugenio Pacheco

Yes, this is the way. But note, that there can be some problems with running this modules inside VE. We've never reviewed these modules: probably they can't work in VE without proper virtualization.

Vasily.
