Hi all,

I am glad to announce version 1.0 of vldump. vldump is an utility to make consistent snapshots of running OpenVZ VEs. It basically creates a tar archive of the VE private area, which also includes the VE configuration files.

Vldump 1.0 is now available for download:

http://www.proxmox.com/cms_proxmox/en/virtualization/openvz/vldump/

or

<http://download.openvz.org/contrib/utis/vldump/>

New Features:

- vldump --mailto: generate nice text/html mails with additional status info's
- allow multiple receivers (multiple --mailto options)
- new --exclude option to exclude some VEs
- new --exclude-path option, use 'find' to avoid tar sockets warnings, try to skip all log files by default
- better log format includes time

An installation Howto is also available:

http://wiki.openvz.org/Backup_of_a_running_VE_with_vldump

Upgrade and enjoy!

- Dietmar
