Subject: Config files
Posted by scooter on Sun, 19 Feb 2006 02:09:42 GMT

I know this has been discussed before, but i'm sorta still at a loss on the exact specifications it should be.

If a config file for for the below templates is needed, what would need to be set for memory? and wanting to burst to 1 gig of ram.

256 meg, 384 meg, 512 meg.

From looking at the hybodus config, just to try and grip it, it shows:

#128 MB RAM
VMGUARPAGES="6144:2147483647"

So for 256, would it just be 6144*2 and so forth?

Also do the configs for VE work the same as openvz's i presume?

And just curiosity, how much ram is the line below dedicating to a ve?

VMGUARPAGES="18432:2147483647"

Thanks in advance.

None, if I'm not mistaken. It guarantees 18432 4K pages
(some 72MB) of _virtual_ memory. It might be in the RAM
but it doesn't have to.
