Subject: Starting Asterisk PBX: Unable to set high priority

Hi All...

I just created a Debian Etch 32bit VPS and installed Asterisk, per the wiki instructions. When I start it, it starts and keeps running, but it reports:

Starting Asterisk PBX: Unable to set high priority

Is this fixable and, if not, is it a problem? What causes it?

Thanks...

Jim,

I guess because it tried to change scheduling policy to something like SCHED_FIFO or SCHED_RR, which are real-time priorities and can't be set w/o CAP_SYS_ADMIN capability.

Nothing bad should happen if you don't run other CPU hungry services in this VE.
Also, you can grant CAP_SYS_ADMIN to VE with vzctl, but this is highly insecure and not recommended.

Thanks,
Kirill
