Subject: openvz with latest stable kernel release

Hello all.

I'm having problem patching kernel 2.6.18.8 with latest combined patch
for 2.6.18. It says that already patched and so on. And I have one
question. Is combined patch contains latest changes to stable kernel?
Like 2.6.18.8. If yes why, and if no why?

yes, it has 2.6.18.8 patch inside.
why? To make sure people have all the required fixes
(including security fixes which were not included in 2.6.18.x branch)

Thanks,
Kirill
