standard install of CentOS 4.5 on a twin dual-core 2GB remote server

- i have installed the ovzkernel 2.6.18-8.1.8.el5.028stab039.1PAE
- 1 have created a VE 101 with centos-4i386-default
- i have set the external IP into VE 101
- i have set the VE to start on HN boot
- i have set the hostname
- i have set the the diskpace

i can ping the VE IP from the HN

ssh is running in the VE, i can update and install in the VE using vzyum

problem: there is no network in the VE. from within the VE i cannot reach any host. from a remote desktop if i ssh to the VE i land in the HN

the Wiki and the PDF User Gude do not cover this problem

i have been told by a senior member of the forum that 10,000 of people have successfully installed OpenZV. is there anyone plz who knows why the VE is not networked?

thanks in advance

Most interesting fact here is that external connections lands in HW.

Could you please try to ping VE when VE is stopped?

thank you,
Vasily Averin

This problem has been solved... it turned out that the hn was configured to have eth0:0 - eth0:9 and the hn was trapping the network traffic before it was getting to the vps. Removing the eth0:0 - eth0:9 configuration on the hn resolved the problem.
