Hello,

I need to use scientific linux in virtual envirement. I installed openvz, it's running, but there are no templates for it.

So what to do? How can I make/gerenate my own template, or can I mount install iso file to /mnt/cdrom and install it to /vz/templates/scientific/4.5/ somehow?

As I see Scientific linux is build from RHEL, and it must be same as RHEL. Try http://wiki.openvz.org/OS_template_cache_preparation. Please note that I've no experience using any RH stuff.
