Subject: Heartbeat inside guest network / interface problems
Posted by Mikeynl on Mon, 03 Sep 2007 17:56:13 GMT

We are testing with heartbeat inside openvz guest systems, but we ran into an problem.

Guests cant initialize the failover ip that should switch between the guest. When i add th ip adress through hypervm, only the vps where i added the ip can use it.

The scope and route is set for that ip.

How can i add an ip on the host so that other guest accounts can use it.

Anyone any clue for this workaround ?

Mike
