Subject: vzmemcheck results interpretation
Posted by UI_ICT on Tue, 04 Sep 2007 09:16:08 GMT

Hi all,
how do you interpret "vzmemcheck" results?
for example , since vzmemcheck -A shows the results in % , is it normal for the summary of all
VE's Alloc limit to be greater than 100 ?
I think the summary of all columns should be less than 100%,is this correct? what about each row,
is there any acceptable range for each of the VE's utility or commitment values?
Regards.

You can find the explanation on the link below:
 http://wiki.openvz.org/UBC_systemwide_configuration#Allocate d_memory

In practice, a lot of applications do not use the memory very efficiently and, sometimes, allocated
memory will never be used later. For example, Apache Web server at start time it allocates about
20–30%% more memory that it will ever use. Some multi-threaded applications are especially
bad at using their memory, and their rate of allocated to used memory may happen to be 1000%.

thank you,
      Vasily Averin
