Hi there,

I'm trying to configure a firewall on a VM running Debian 4.0. The Hardware Node runs CentOS (kernel 2.6.9-023stab043.2-smp) with OpenVZ.

I'm using the following rules:

```
iptables -F
iptables -P INPUT DROP
iptables -P FORWARD DROP
iptables -P OUTPUT ACCEPT
```

```
iptables -A INPUT -j ACCEPT -p tcp --dport 21
iptables -A INPUT -j ACCEPT -p tcp --dport 22
iptables -A INPUT -j ACCEPT -p tcp --dport 80
```

```
iptables -A INPUT -m state --state ESTABLISHED,RELATED -j ACCEPT
```

The last rule fail with this error message:

```
utopia:~# iptables -A INPUT -m state --state ESTABLISHED,RELATED -j ACCEPT
iptables: No chain/target/match by that name
```

On my machine running Ubuntu 7.04 I can use this rules without problem. So I think this might be related with some missing kernel module, but I can't find out which. Any ideas?

Thanks, Rodrigo.

Hi,

are you able to run successfully this command on HN?

Thanks,
Vasily

If you want to have a firewall on your host node... and firewall your VPSes... and control everything from the host node... the firewall script in the OpenVZ wiki works really well and is pretty simple to understand:

http://wiki.openvz.org/Setting_up_an_iptables_firewall

Since you are using CentOS on your hardware node, it will work without any modifications.
