Subject: Quota file is gone!

Posted by [silentninja](#) on Thu, 06 Sep 2007 20:10:00 GMT

[View Forum Message](#) <> [Reply to Message](#)

---

Today i noticed that on one of our VPS servers, the aquota.user and aquota.group files are gone... i mean, they're symlinks to /proc/vz/vzaquota/\*/aquota... but... there's nothing in vzaquota.

On the conf file I've set the quotauid option and the fstab looks fine to me:

# This file is edited by fstab-sync - see 'man fstab-sync' for details

```
/dev/sda5    /          ext3    defaults,usrquota 1 1
/dev/sda1    /boot      ext3    defaults,usrquota 1 2
/dev/sda3    /tmp       ext3    defaults,noexec,usrquota 1 0
none        /dev/pts   devpts  gid=5,mode=620 0 0
none        /proc      proc    defaults 0 0
none        /dev/shm   tmpfs   defaults 0 0
/dev/sda2    swap       swap    defaults 0 0

/dev/sdb1    /vz/private/101    ext3    defaults,usrquota 0 0
/dev/sdb2    /vz/private/102    ext3    defaults,usrquota 0 0
/dev/sdb3    /vz/private/103    ext3    defaults,usrquota 0 0
/dev/sdb5    /vz/private/105    ext3    defaults,usrquota 0 0
/dev/sdb6    /vz/private/106    ext3    defaults,usrquota 0 0
/dev/sdb7    /vz/private/107    ext3    defaults,usrquota 0 0
/dev/sdb8    /vz/private/108    ext3    defaults,usrquota 0 0
/dev/sdb9    /vz/private/109    ext3    defaults,usrquota 0 0
/dev/sdb10   /vz/private/110    ext3    defaults,usrquota 0 0
/dev/sdc     /backup         ext3    defaults          1 2

/dev/hda     /media/cdrom      auto    pamconsole,exec,noauto,managed 0 0
```

sda is the OS disk, sdb is where I store my vps servers and sdc is a backup disk. Do you have any idea why the proc vzaquota file is not there anymore? Is there any fix to rebuild it?

I've tried a quotacheck on each vps, but it creates the aquota file and not the aquota symlink... as a part time solution works... until i restart that vps and boom, it gets overwritten.

I've googled searching for this, but I've only found how to fix the broken symlink, but not the other way around that i need.

Hi,

Can you tell us please full OpenVZ kernel version you're using?

Thank you,  
Vasily

I'm using a OpenVZ Kernel: 2.6.9-023stab016.2-smp  
The servers are running on a x64 intel pentium processor.

There's no relationship between your question and mine... post a new topic please.

Hello,

I think you have mistaken. When you check the private area from main server, it will show the links as broken,because it is actually linking to the ve's proc and not to the main server proc.

```
root@me(~)$ ls -al /vz/private/101/
```

```
total 92
```

```
lrwxrwxrwx  1 root root   39 Sep  8 09:36 aquota.group ->
/proc/vz/vzaquota/0000000f/aquota.group
```

```
lrwxrwxrwx 1 root root 38 Sep 8 09:36 aquota.user -> /proc/vz/vzaquota/0000000f/aquota.user
drwxr-xr-x 2 root root 4096 May 26 15:47 bin
drwxr-xr-x 2 root root 4096 Feb 22 2005 boot
drwxr-xr-x 4 root root 16384 Sep 8 09:36 dev
drwxr-xr-x 42 root root 4096 Sep 8 09:36 etc
```

Now start the node 101 and do the following

```
root@me(~)$ vzctl enter 101
entered into VE 101
root@neverdelete//#ls -al
total 92
drwxr-xr-x 22 root root 4096 Sep 8 08:06 .
drwxr-xr-x 22 root root 4096 Sep 8 08:06 ..
-rw-r--r-- 1 root root 0 Sep 8 08:06 .autofsck
lrwxrwxrwx 1 root root 39 Sep 8 08:06 aquota.group ->
/proc/vz/vzaquota/0000000f/aquota.group -
lrwxrwxrwx 1 root root 38 Sep 8 08:06 aquota.user ->
/proc/vz/vzaquota/0000000f/aquota.user
```

The link "aquota.group -> /proc/vz/vzaquota/0000000f/aquota.group" is linking to  
/vz/root/101/proc/vz/vzaquota/0000000f/  
See it below,

```
root@me(~)$ ls -al /vz/root/101/proc/vz/vzaquota/0000000f/
total 263192
-r----- 1 root root 134754304 Sep 8 09:57 aquota.group
-r----- 1 root root 134754304 Sep 8 09:57 aquota.user
```

```
root@me(~)$
Please refer the attachment
```

No I'm not, there's nothing in the /proc/vz/vzaquota INSIDE any vps of the server, there's just nothing there where it should be...

```
root@vps1 [/]# vzctl enter 103
entered into VPS 103
-bash-3.00# ls -l /
total 160
```

```
lrwxrwxrwx 1 root root 39 Sep 4 14:46 aquota.group ->
/proc/vz/vzaquota/00000017/aquota.group
lrwxrwxrwx 1 root root 38 Sep 4 14:46 aquota.user ->
/proc/vz/vzaquota/00000017/aquota.user
drwx--x--x 3 root root 4096 Oct 1 2006 files
```

```
-bash-3.00# cd /proc/vz/vzaquota/
-bash-3.00# ls -la
total 0
dr-x----- 2 root root 0 Sep 8 11:56 .
dr-xr-xr-x 3 root root 0 Sep 8 11:56 ..
```

hello,

Make sure the second level quota is enable in that vps

```
# grep -i quotaugidlimit /etc/vz/conf/114.conf
If not please set the quotaugidlimit as follows,then restart the vps.
```

```
#vzctl set 114 --quotaugidlimit 500 --save
```

mastersherin wrote on Sun, 09 September 2007 02:51hello, Make sure the second level quota is enable in that vps

```
root@vps1 [~]# grep -i quotaugidlimit /etc/vz/conf/103.conf
QUOTAUGIDLIMIT="1000"
```

It it enabled, but isn't working, that's really why i don't understand it.. because i've other webserver that works totally fine

Isn't there any way to "auto recreate aquota files"?  
Like the quotacheck on linux, but for vz

Hello,

Can you check the quota module "vzdquota" is loaded or not.

```
# lsmod |grep -i vzdquota
```

Also which kernel you using ,rpm or compiled kernel

---

---

mastersherin wrote on Sun, 09 September 2007 03:25# lsmod |grep -i vzdquota

Also which kernel you using ,rpm or compiled kernel

```
root@vps1 [~]# lsmod |grep -i vzdquota
```

```
vzdquota          38496  6 [permanent]
```

```
vzdev             3584  4 vznetdev,vzethdev,vzdquota,vzmon
```

Outside the vps, it's installed, i didn't tested inside one of the vps's at the webserver. The kernel i've named previously, it's vzkernel: Linux 2.6.9-023stab016.2-smp

I'm on a x86\_64 GNU/Linux (CentOS 5), the odd thing is that I've other 3 webserver installed the exact same way.. that DO work. There must be something we're not seeing in here.

Hello, I've tried as far as I can think everything.. I've updated the kernel up to the latest version, vzaquota is installed and updated.. so, that's out of the bounds.

I've also tried to create the folder itself so the quotacheck creates the aquota files correctly, but the server doesn't allowed me to write under the proc folder, so, if I do a quotacheck and fixquotas, the thing solves, but if I restart the vps or the server itself, the aquota files are deleted and new broken links instead of them.. I may be able to do a +i to the aquota files, but hey, if i do that i wont get any quotas working neither.

This is my fstab:

```
/dev/sda5    /                ext3 defaults          1 1
/dev/sda1    /boot            ext3 defaults          1 2
/dev/sda3    /tmp             ext3 defaults,noexec,usrquota 1 0
none        /dev/pts         devpts gid=5,mode=620  0 0
none        /proc            proc defaults          0 0
none        /dev/shm         tmpfs defaults         0 0
/dev/sda2    swap             swap defaults          0 0

/dev/sdb1    /vz/private/101  ext3 defaults          1 2
/dev/sdb2    /vz/private/102  ext3 defaults          1 2
/dev/sdb3    /vz/private/103  ext3 defaults,usrquota 1 2
/dev/sdb5    /vz/private/105  ext3 defaults          1 2
/dev/sdb6    /vz/private/106  ext3 defaults          1 2
/dev/sdb7    /vz/private/107  ext3 defaults          1 2
/dev/sdb8    /vz/private/108  ext3 defaults          1 2
/dev/sdb9    /vz/private/109  ext3 defaults          1 2
/dev/sdb10   /vz/private/110  ext3 defaults          1 2

/dev/sdc     /backup          ext3 defaults          1 2

/dev/hda     /media/cdrom     auto pamconsole,exec,noauto,managed 0 0
```

My mtab looks like this..

```
/dev/sda5 / ext3 rw 0 0
none /proc proc rw 0 0
none /dev/pts devpts rw,gid=5,mode=620 0 0
usbfs /proc/bus/usb usbfs rw 0 0
/dev/sda1 /boot ext3 rw 0 0
/dev/sda3 /tmp ext3 rw,noexec,usrquota 0 0
none /dev/shm tmpfs rw 0 0
/dev/sdb1 /vz/private/101 ext3 rw 0 0
/dev/sdb2 /vz/private/102 ext3 rw 0 0
/dev/sdb3 /vz/private/103 ext3 rw,usrquota 0 0
/dev/sdb5 /vz/private/105 ext3 rw 0 0
/dev/sdb6 /vz/private/106 ext3 rw 0 0
/dev/sdb7 /vz/private/107 ext3 rw 0 0
/dev/sdb8 /vz/private/108 ext3 rw 0 0
/dev/sdb10 /vz/private/110 ext3 rw 0 0
/dev/sdc /backup ext3 rw 0 0
none /proc/sys/fs/binfmt_misc binfmt_misc rw 0 0
sunrpc /var/lib/nfs/rpc_pipefs rpc_pipefs rw 0 0
/dev/sdb9 /vz/private/109 ext3 rw 0 0
```

I've this rpms installed on the main server:

```
root@vps1 [/]# rpm -qa | grep vz
vzctl-lib-3.0.11-1
vzrpm43-python-4.3.3-7_nonptl.6
vzpkg-2.7.0-18
vzquota-3.0.8-1
vzrpm43-4.3.3-7_nonptl.6
vzrpm44-4.4.1-22.5
vzyum-2.4.0-11
vztmpl-centos-4-2.0-2
vzctl-3.0.11-1
vzrpm44-python-4.4.1-22.5
ovzkernel-smp-2.6.9-023stab044.11
```

The server is a 64 bits machine, here's the uname and linux distro:

```
root@vps1 [/]# uname -a
Linux vps1.nuthost.com 2.6.9-023stab044.11-smp #1 SMP Sun Sep 30 13:46:07 MSD 2007
x86_64 x86_64 x86_64 GNU/Linux
```

```
root@vps1 [/]# cat /proc/version
Linux version 2.6.9-023stab044.11-smp (root@rhel4-64) (gcc version 3.4.5 20051201 (Red Hat 3.4.5-2)) #1 SMP Sun Sep 30 13:46:07 MSD 2007
```

I'm really lost.. my clients are worried about their users having unlimited quotas and I've no idea of where this comes from.. the wierdest thing is that i've another webserver hired at ev1 with the exact same configuration and.. that one works.. but this one doesn't :@

mastersherin wrote on Thu, 01 November 2007 05:14what template you using ?  
The template is from a Centos4 with cPanel and the server runs as RedHat Linux.

---

Subject: Re: problem....

Hi, I'm still having this issue.. I've bypassed the quotas issue by deleting the links, creating the quota files with "quotacheck -a", and fixing the cpanel with "/scripts/fixquotas".. but still each time the server or vz service reboots, this rollback, deletes the quota files and remakes the broken links.. so I've to wait another half an hour for each vps to be fixed.

Do you know any way to recreate the quotas keeping the link file, or avoiding the aquota files for being deleted and pointed nowhere?

Hi, I have this same problem on 2.6.18 el5 openvz branch. I have moved the VE to another node which has many VEs not experiencing the problem, but the problem remains.

to be clear, the problem is that /proc/vz/vzaquota is empty inside the VE

2nd level quotas enabled  
quotauid set in ve.conf

I've replied here with the solution, but my post is gone.. oh well, here goes again.

Check that on /etc/vz/vz.conf there's the "QUOTA" option in ON.. it's that simple. After that, go inside the server and (if you have cpanel) execute /scripts/fixquotas.

If you haven't you may have to do..

```
vzctl stop ID
vzquota off ID
vzquota on ID
vzctl start ID
```

I don't remember if the ID on the vzquota should be in the middle, but you'll know if it fails.
