I can´t use the last instructions:
 http://wiki.openvz.org/Install_OpenVZ_on_a_x86_64_system_Cen tos-Fedora
in Fedora Core 5.

For example:

cd /usr/share/vzpkgtools/vzrpm43/lib/python2.3/site-packages/
cp /usr/lib64/python2.3/site-packages/rpmmodule.so .
cp: overwrite `./rpmmodule.so'? y
cd /usr/share/vzpkgtools/vzrpm43/lib/python2.3/site-packages/rp mdb
cp /usr/lib64/python2.3/site-packages/rpmdb/_rpmdb.so .
cp: overwrite `./_rpmdb.so'? y

Fedora Core 5 have python2.4 and the paths are completly diferent.

Have instructions working for Fedora Core 5?

It is not an answer to your problem, but I suggest you use a more robust and stable distro for a
server: Centos 5 is free!

Yes, but the problem is I current have a server with FC5 running, and I need to install a VPS
server and migrate the same server services into the VPSs.

OpenVZ don´t have help to Fedora?

Ok

It probably has support for fedora core 5, but I can't help you because I don't use it.

It was just a suggestion.

The problem is there's way hard to build a static version of rpm for x86_64. This is why we do not support vzrpm/vzyum for x86_64.

Hacks exist, and you can use those.
