Hi to all,

i have some problems with openvz and the scsi controller from Adaptec. It's the AIC-7899 model (onboard).

I shortly describe my system:

It's a P4 1.9Ghz with 1GB RAM. Fedora Core4 is installed and configured like described in the openvz documentation. Fedora boots without any probs and the Harddrive at the SCSI Controller is found.

The Problem comes while installing ovzkernel-2.6.8-022stab070.1.i686.rpm

While installing there was a Warning like this:

WARNING: no driver found for AIC-78XX found continuing anyway

(that is not the original warning - but very similarly)

After this i installed vzctl, vzquota and vzpkg and of course all needed packages for right dependencies. The Bootloader and the sysctl Parameters are configured too.

Finally i wanted to start the vz with

/etc/init.d/vz start

but the command failed.

vz status is telling me that vz is not running.

I looked at the hardware compatibility list linked to the virtuoizzo site there is my scsi controller listed.

Has anybody out there an idea to make my vz run?

On another machine (with IDE Controller) i have vz still running for testing - but the "real" server should have an SCSI drive.

I would be happy about every Info.

Thanks a lot.

Lars.

You need to reboot to OpenVZ kernel. Don't worry about warning - this driver is builtin in our kernel, while in Fedora it is a module.

Oh noooooo!

Now it works fine - thank you for the tip!!! i could not believe that this tiny info was my fault

Thank you very very much!!!!
