Subject: pspace name

Posted by [Cedric Le Goater](#) on Thu, 07 Sep 2006 13:22:30 GMT

[View Forum Message](#) <> [Reply to Message](#)

---

all,

'pspace' sounds wrong when you know about the other namespaces :

```
struct nsproxy {
  atomic_t count;
  spinlock_t nslock;
  struct uts_namespace *uts_ns;
  struct ipc_namespace *ipc_ns;
  struct user_namespace *user_ns;
  struct namespace *namespace;
};
```

'proc\_namespace' might be confusing, what about 'task\_namespace' ?

'namespace' should probably be renamed to something like 'mnt\_namespace' ?

C.

yes, I also wanted to point to this, but probably missed in a hurry.

task\_ns/task\_namespace looks fine, doesn't it?

> 'namespace' should probably be renamed to something like 'mnt\_namespace' ?

struct: mnt\_namespace

fields: mnt\_ns

is the patch below ok for you?

what about vfs\_namespace?

just an idea,  
best,  
Herbert

imho later we will need introduce fs namespace etc.  
at least I see additional fs\_namespace which allows to control which filesystems are visible  
in the context. And such fs\_namespace should be separate from mnt\_namespace.

Kirill

yep.

touch\_mnt\_namespace() and the namespace\_sem could be renamed but they are  
private to namespace.c, so no big issue. here's a port of your patchset for

2.6.18-rc6 which could be used before -mm ?

thanks,

C.

this patch renames 'struct namespace' to 'struct mnt\_namespace' and 'namespace' variables to 'mnt\_ns' to avoid confusion with other namespaces being developed for the containers.

do you think we need to send it to Linus to 2.6.18-rc6?

I think we should keep sending such changes to -mm IMHO...

Thanks,  
Kirill

Yeah, I agree.

```

```

task\_ might do. I don't have any better ideas.

> 'namespace' should probably be renamed to something like 'mnt\_namespace' ?

fs\_namespace? This is probably a "do a patch and CC Viro" kind of thing.

Could you elaborate on this a bit?

I wrote it in another email to Eric:

proc-ns,  
sysfs-ns,  
printk-ns or syslog-ns?: syslog should be virtualized  
and more...

semi-namespaces:

fs-ns (should regulate which filesystems are accessible from container, but probably this is not exact name space... need to think over...),  
dev-ns (should regulate which devices are accessible from container)

Kirill
