hi,

I just installed some slackware packages in a chroot environment under /vz/private/888. I sort of followed the guide on making a debian template. When I tried to start the vps, I get the following error.

```
vzquota : (error) quota check: crossing mount point  
vzquota init failed [8]
```

/vz/private/888/ is on its own partition. Maybe that's the problem? if that's the case, how do I fix this?

I'm quiet new to linux and all, so maybe someone can point me to some how-to or guides regarding this, instead of walking me through step by step.

both VPS root and private directories should reside on the same partition.

You can fix it in 2 ways:

1. recommended way is to have whole /vz on a separate partition.

2. You can change VPS configuration
/etc/sysconfig/vz-scripts/<VPSID>.conf:
VE_ROOT="/vzt/root/\$VEID"
VE_PRIVATE="/vzt/private/\$VEID"
so that both dirs would reside on the same partition.

Thanks for the info. So there is no simple way of having one vps per partition, no?

Why "no"? YES!

Just change VPS config as I suggested to you.
