the vps leak memory have 3 gb ram and run 3 vps

RAM Total Used Free

2.97 GB 2.48 GB 496.24 MB

how clean the buffer or ram or another solution

my vps run debian

my host run centos 4.2

Thank you

without reboot the system !

Sorry I don't really understand what you mean. Could you be more specific?

Please note that RAM is also used for buffers and cache, so there is nothing wrong with the fact that most RAM is used -- Linux is wise in that regard and use (otherwise) free RAM for cache.

dear kir

have only 3 vps debian fresh install and my host tell me that i use 1.5 gb ram

how can clean the cache

Please read a book/the documentation about the linux memory management.  
please also try to look into the output of the command "free". It looks like

	total	used	free	buffers	cached
Mem:	2057604	2037524	20080	23640	1045648

-/+ buffers/cache: 968236 1089368  
Swap: 2996112 2684 2993428

As you can see I have 2 GB of memory and only 26MB free BUT - and that is important - I also have 23 MB of buffer space and about 1GB of cache space. So in reality I have about 1 GB of free memory because the cache and buffer space is allocated dynamically.

I only have 1 GB of free memory because that is my workstation and I just use a large java application.

You can change that behaviour if you know what your are doing with sysctl.

Bernhard

To start with, there is no sense to free that memory used by cache -- it will be freed as soon as it will be needed. It's just Linux doesn't waste resources -- but rather uses them wisely.

To continue with, this is not a problem, and this is in no way OpenVZ-related.

To end with, here are some more info on topic:

kir you think this will not issue?

have 3 gb after create vps user and i type free cache go up

1 user total 700 mb in cache

is not way to release the cache ?

the solution is reboot !

but i think is not good idea

any one has same problem ?

Thank you

Again, in plain English:

this is not a problem

If you think it is -- please explain why you think so.
