That's assuming that you're using network namespace virtualization,
with each group of tasks in a separate namespace. What if you don't
want the virtualization overhead, just the accounting?

Paul

correct ...

there should be no 'virtualization' overhead, and what
do you want to account for, if not by a group of tasks?

maybe I'm missing the grouping condition here, but I
assume you assign tasks to the accounting containers

note: network isolation is not supposed to add overhead
compared to the host system (at least not measureable
overhead)

best,
Herbert

Does "network isolation" involve giving each network namespace a
separate IP address, etc? If so, that's something that some people
might not want (and specifically, that we don't want). If not, what
does it add over existing Linux traffic control (via tc)?

Thanks,

Paul
