In my initial version, I did same. It doesn't work :(

copy_*_ns() routines doesn't return any errors. All they return is NULL
in case of a
failure + with the exception of copy_mnt_ns, there are no other failure
cases.
So, there is no way to find out why the copy_*_ns() routines failed from
create_new_namespaces().
If you really really want to do this, change all copy_*_ns() routines to
returns meaningful
errors instead of NULL.

Hmm.. copy_user_ns() ? I don't see this in rc4-mm2.

Thanks,
Badari

mnt ant uts namespaces return NULL right but this is not true for ipc namespace
which returns -ENOMEM. user namespace returns -EINVAL if CONFIG_USER_NS is not
selected. I expect pid namespace to do same and net namespace to do even more.

I will certainly do and change mnt ant uts namespaces to return -ENOMEM but
we will still require the patch below.

```

it's in the -mm stack.

C.

Here's a second try to apply on top of -mm branch,

Thanks for the review Badari.

C.

The following patch modifies create_new_namespaces() to also use the
errors returned by the copy_*_ns routines and not to systematically
return ENOMEM.

Changes since [try #1]:
- fixed return values of clone_*_ns() routines
