Subject: [-mm PATCH 0/7] Memory controller introduction
Posted by Balbir Singh on Wed, 04 Jul 2007 22:21:08 GMT
View Forum Message <> Reply to Message

Resending with the patch numbering fixed and linux-mm copied

This patchset implements another version of the memory controller. These patches have been through a big churn, the first set of patches were posted last year and earlier this year at
http://lkml.org/lkml/2007/2/19/10

Ever since, the RSS controller has been through four revisions, the latest one being
http://lwn.net/Articles/236817/

This patchset draws from the patches listed above and from some of the contents of the patches posted by Vaidyanathan for page cache control.
http://lkml.org/lkml/2007/6/20/92

Pavel, Vaidy could you look at the patches and add your signed off by where relevant?

At OLS, the resource management BOF, it was discussed that we need to manage RSS and unmapped page cache together. This patchset is a step towards that

TODO's

1. Add memory controller water mark support. Reclaim on high water mark
2. Add support for shrinking on limit change
3. Add per zone per container LRU lists
4. Make page_referenced() container aware
5. Figure out a better CLUI for the controller

In case you have been using/testing the RSS controller, you'll find that this controller works slower than the RSS controller. The reason being that both swap cache and page cache is accounted for, so pages do go out to swap upon reclaim (they cannot live in the swap cache).

I've test compiled the framework without the controller enabled, tested the code on UML and minimally on a power box.

Any test output, feedback, comments, suggestions are welcome!

Subject: [-mm PATCH 1/7] Memory controller resource counters
Posted by Balbir Singh on Wed, 04 Jul 2007 22:21:20 GMT
View Forum Message <> Reply to Message

Introduce generic structures and routines for resource accounting.

Each resource accounting container is supposed to aggregate it,
container_subsystem_state and its resource-specific members within.

Posted by Balbir Singh on Wed, 04 Jul 2007 22:21:49 GMT
View Forum Message <> Reply to Message

Basic setup routines, the mm_struct has a pointer to the container that
it belongs to and the the page has a meta_page associated with it.

Subject: [-mm PATCH 4/7] Memory controller memory accounting
Posted by Balbir Singh on Wed, 04 Jul 2007 22:22:03 GMT
View Forum Message <> Reply to Message

Add the accounting hooks. The accounting is carried out for RSS and Page
Cache (unmapped) pages. There is now a common limit and accounting for both.
The RSS accounting is accounted at page_add_*_rmap() and page_remove_rmap()
time. Page cache is accounted at add_to_page_cache(),
__delete_from_page_cache(). Swap cache is also accounted for.

Each page's meta_page is protected with a bit in page flags, this makes
handling of race conditions involving simultaneous mappings of a page easier.

A reference count is kept in the meta_page to deal with cases where a page
might be unmapped from the RSS of all tasks, but still lives in the page
cache.

Subject: [-mm PATCH 5/7] Memory controller task migration
Posted by Balbir Singh on Wed, 04 Jul 2007 22:22:21 GMT
View Forum Message <> Reply to Message

Allow tasks to migrate from one container to the other. We migrate
mm_struct's mem_container only when the thread group id migrates.

Signed-off-by: Balbir Singh <balbir@linux.vnet.ibm.com>

Subject: [-mm PATCH 6/7] Memory controller add per container LRU and reclaim
Posted by Balbir Singh on Wed, 04 Jul 2007 22:22:34 GMT
View Forum Message <> Reply to Message

Add the meta_page to the per container LRU. The reclaim algorithm has been
modified to make the isolate_lru_pages() as a pluggable component. The
scan_control data structure now accepts the container on behalf of which
reclaims are carried out. try_to_free_pages() has been extended to become
container aware.

Subject: [-mm PATCH 7/7] Memory controller OOM handling
Posted by Balbir Singh on Wed, 04 Jul 2007 22:22:53 GMT
View Forum Message <> Reply to Message

Out of memory handling for containers over their limit. A task from the
container over limit is chosen using the existing OOM logic and killed.

TODO:
1. As discussed in the OLS BOF session, consider implementing a user
space policy for OOM handling.

As far as I remember at OLS we decided to implement per-zone RLU
lists and reuse the lru lock as well. This will remove all the

problems with per-container lists inconsistency.

Separate limits for RSS and RSS+pagecache are also a must.

BTW, if you send smb. else's patches you may include a 'From: xxx'
line into the letter to address the original author.

It's there in the TODO list. It is easy to implement. I can do that
in the next revision. We are re-using the LRU lock, since the
isolate_pages callback is called under the zone's LRU lock.

> Separate limits for RSS and RSS+pagecache are also a must.
>

I remember that we discussed having one limit, but we can come up
with a configuration parameter to do it. I'll do that in the
next release.

> BTW, if you send smb. else's patches you may include a 'From: xxx'
> line into the letter to address the original author.
>

I'll do that for the res_counters_infra patch. Although I had used
res_counter, the hooks in mm_struct earlier (http://lkml.org/lkml/2007/2/19/12).

A lot of the code for the reclaim logic and the meta_page is yours.
Please do identify patches where you would like to see your
signed-off-by and where you think the entire patch is completely
yours.

This I still disagree upon. Page-cache limits are orthogonal to containers and not a requirement for containers. If you want such a feature get it in Linux proper and don't sneak it in the backdoor via containers.

What I wanted to say is that *iff* we need limit for booth the RSS and the page cache, then we do need a separate limit for the RSS only. I do not vote for the page cache limit either, but I do not vote _against_ it as well, and agree to take part in its development.

Thanks,
Pavel.

Peter,

In these patches, we provide memory control that includes
mapped pages and unmapped pages (as discussed in the BOF). All memory
is treated uniformly. We will not have separate page cache control,
what we can have is control for either mapped pages or control
for a combination of mapped and unmapped pages together.
