Subject: Live Migration and shell

Hi all,

I did a Live Migration today using two hardware nodes that were running the OpenVZ Kernel 2.6.18-028stab035. Before live migrating, I started a screen session inside the VE and in the screen sessions' shell I launched the following command:

    while [true]; do date; sleep 1; done

After the migration I entered the VE and the screen session but the while loop wasn't running anymore. It wasn't printing the date every second as expected. When I do chechkpointing and restoring on the same machine the loop is running fine after restoring.

Is there someone experiencing the same problem?

Christian,

Most likely you have too much unsychronized time on these machines.
Please synchronize it with NTP or by hands and retry.

Kirill

You're right!
Different time zones and an unsynchronized clock must have caused the
error. I think the "sleep 1" caused the error because the SIG_ALARM was on
the other host not after one second but after a few hours ;-)
