Denis V. Lunev <den@sw.ru> noticed that the locking rules for the network namespace list are over complicated and broken.

In particular the current register\_netdev\_notifier currently does not take any lock making the for\_each\_net iteration racy with network namespace creation and destruction. Oops.

The fact that we need to use for\_each\_net in rtnl\_unlock() when the rtinetlink support becomes per network namespace makes designing the proper locking tricky. In addition we need to be able to call rtnl\_lock() and rtnl\_unlock() when we have the net\_mutex held.

After thinking about it and looking at the alternatives carefully it looks like the simplest and most maintainable solution is to remove net\_list\_mutex altogether, and to use the rtnl\_mutex instead.
