Hi,

I am using PHP with Apache.
I compiled php with Apache support and created libphp5.so.
To give SSH2 support for PHP, i had created ssh2.so using PECL/SSH package.

To work with PHP, i copied the ssh2.so to /usr/php/extensions and add entry in php.ini file.

Is there any way to run PHP with SSH support in Apache, if so please let me know how to compile this.

Is there any option to compile PHP with SSH2 support to make it work in Apache.

I am using Linux machine.
Apache version is 2.0.47.
Latest PHP Version.

Thanks & Regards,
Prasanna

your question isn't a good match for this forum. This is a forum for discussing Openvz Linux virtualization technology and uses.

check out linuxquestions.org, linuxforum.com

Rick
