This is just a quick hack, I have been making a few test machines and got tired of cut/paste into putty to download utils and kernels.

vzfetch.sh:

```
#!/bin/bash
OPENVZ_KARCH="i686"
OPENVZ_UARCH="i386"
OPENVZ_SRC="/usr/local/src/openvz"

mkdir -p $OPENVZ_SRC/{kernel,util,template}

wget --quiet -O - http://openvz.org/download/kernel/ | grep http:// | egrep
"(${OPENVZ_KARCH}|noarch)".rpm | sed "s/.*http:/http:/; s/'>.*//g;" | xargs wget -c -P
${OPENVZ_SRC}/kernel/

wget --quiet -O - http://openvz.org/download/utils/ http://openvz.org/download/template/utils/ | grep
http:// | grep "(${OPENVZ_UARCH}|noarch)".rpm | sed "s/.*http:/http:/; s/'>.*//g;" | xargs wget -c
-P ${OPENVZ_SRC}/util/

wget --quiet -O - http://openvz.org/download/template/metadata/ | grep http:// | grep
"(${OPENVZ_UARCH}|noarch)".rpm | sed "s/.*http:/http:/; s/'>.*//g;" | xargs wget -c -P
${OPENVZ_SRC}/template/
```

or oneliner:

```
wget --quiet -O - http://openvz.org/download/kernel/ http://openvz.org/download/utils/
http://openvz.org/download/template/utils/ http://openvz.org/download/template/metadata/ | egrep
"http://.*(i386|i686|noarch)\.rpm" | sed "s/.*http:/http:/; s/'>.*//g;" | xargs -t wget -r -nH -c -P
/usr/local/src/openvz
```
