I have installed this:

```
# rpm -qa | grep vz
vzctl-3.0.18-1
vzrpm44-python-4.4.1-22.5
kernel-smp-2.6.18-ovz028stab045.1
vzquota-3.0.11-1
vzyum-2.4.0-11
vzctl-lib-3.0.18-1
vzpkg-2.7.0-18
vztmpl-fedora-7-1.1-1
vzrpm44-4.4.1-22.5
```

and failed to run vzpkgcache. It was ELF32 _rpmmodule.so installed in /usr/share/vzpkgtools/vzrpm44/lib/python2.4/site-packages/rp m which I replaced with ELF 64-bit from system.

but still no luck.

```

```

is there any successful installation with centos5 x86_64 as a host os?

Hello,

i'm sorry for the question but did you try to remove that file as described on wiki?:

http://wiki.openvz.org/Install_openvz_on_a_x86_64_system_centos

For CentOS-5, you will need to do something a bit different. "rpmmodule.so" is provided in your sitewide python distribution, so instead of copying it across, you need to:

```
rm /usr/share/vzpkgtools/vzrpm43/lib/python2.4/site-packages/rpmmodule.so
```

I followed the recipe for CentOS 5 and it didn't work for me. There was some file (that I don't recall) that was missing so it wouldn't work.

I ended up just putting yum in my VPSes and building my OS templates on i386 machines.

Hmm... interesting.

i'll give it a try. In worst case just will update the wiki, not to raise senseless hopes.
Scott, thank you!

finally I have removed everything and reinstall it as Wiki for centos said. removed .so module for python and get it working.

The only thing I'm missing now is template for centos-5-x86-64.
template for centos-4-x64 and set-x86-64.sh works fine.

You can build templates from this nice metadata package:
<http://forum.openvz.org/index.php?t=rview&th=2512&ri d=1623>.

To get a x64 VPS you simply replace every occurrence of i386 with x86_64. I copied over /vz/template/centos/5/i386 to x86_64 and changed all files with the new links. Works like a charm!
