Subject: [RFC][PATCH] memory cgroup enhancements updated [0/10] intro  
Posted by [KAMEZAWA Hiroyuki](#) on Fri, 19 Oct 2007 09:24:36 GMT  
[View Forum Message](#) <> [Reply to Message](#)

---

These patches are for memory cgroup on my queue.  
Just dumping before week-end.  
I'd like to post these against the next -mm.

This is RFC again.  
Comments for previous version is reflected AMAP, thanks.

Some of patches has no change. Several pathces are new.

[1/10] fix try\_to\_free\_mem\_cgroup\_pages() for NUMA (NEW)  
[2/10] force\_empty for drop all page\_cgroup in empty cgroup. (REFRESHED)  
[3/10] remember page is charged as page cache (changed #define placement)  
[4/10] remember page is on active list (changed #define placement)  
[5/10] per cpu memory cgroup accounting  
[6/10] show per cpu memory cgroup accounting  
[7/10] account failcnt for RSS and CACHE (NEW)  
[8/10] add pre\_destroy handler for cgroup (NEW)  
[9/10] do force\_empty at rmdir() implicitly (NEW)  
[10/10] NUMA-aware accounting. (NEW)

Any comments are welcome.

Thanks,  
-Kame

Subject: [RFC][PATCH] memory cgroup enhancements updated [1/10]  
try\_to\_free\_mem\_cgroup\_pages bugfix  
Posted by [KAMEZAWA Hiroyuki](#) on Fri, 19 Oct 2007 09:29:52 GMT  
[View Forum Message](#) <> [Reply to Message](#)

---

Because NODE\_DATA(node)->node\_zonelists[] is guaranteed to contain  
all necessary zones, it is not necessary to use for\_each\_online\_node.

And this for\_each\_online\_node() makes reclaim routine start always  
from node 0. This is bad.

Subject: [RFC][PATCH] memory cgroup enhancements updated [2/10] force empty interface  
Posted by [KAMEZAWA Hiroyuki](#) on Fri, 19 Oct 2007 09:30:31 GMT  
[View Forum Message](#) <> [Reply to Message](#)

---

This patch adds an interface "memory.force\_empty".  
Any write to this file will drop all charges in this cgroup if  
there is no task under.

%echo 1 > /...../memory.force\_empty

will drop all charges of memory cgroup if cgroup's tasks is empty.

This is useful to invoke `rmdir()` against memory cgroup successfully.

Tested and worked well on x86\_64/fake-NUMA system.

Changelog v4 -> v5:

- added comments to `mem_cgroup_force_empty()`
- made `mem_force_empty_read` return `-EINVAL`
- cleanup `mem_cgroup_force_empty_list()`
- removed `SWAP_CLUSTER_MAX`

Changelog v3 -> v4:

- adjusted to 2.6.23-mm1
- fixed typo
- changes `buf[2]="0"` to static const

Changelog v2 -> v3:

- changed the name from `force_reclaim` to `force_empty`.

Changelog v1 -> v2:

- added a new interface `force_reclaim`.
- changes `spin_lock` to `spin_lock_irqsave()`.

Subject: [RFC][PATCH] memory cgroup enhancements updated [3/10] remember  
pagecache  
Posted by [KAMEZAWA Hiroyuki](#) on Fri, 19 Oct 2007 09:31:06 GMT  
[View Forum Message](#) <> [Reply to Message](#)

---

Add PCGF\_PAGECACHE flag to page\_cgroup to remember "this page is

charged as page-cache."

This is very useful for implementing precise accounting in memory cgroup.

Changelog v1 -> v2

- moved #define to out-side of struct definition

Subject: [RFC][PATCH] memory cgroup enhancements updated [5/10] per cpu

---

Add statistics account infrastructure for memory controller.

Changelog v1 -> v2

- Removed Charge/Uncharge counter
- reflected comments.
- changes \_\_move\_lists() args.
- changes \_\_mem\_cgroup\_stat\_add() name, comment and added VM\_BUGON

Changes from original:

- divided into 2 patch (account and show info)
- changed from u64 to s64
- added mem\_cgroup\_stat\_add() and batched statistics modification logic.
- removed stat init code because mem\_cgroup is allocated by kzalloc().

Subject: [RFC][PATCH] memory cgroup enhancements updated [7/10]  
RSS/CACHE failcnt  
Posted by [KAMEZAWA Hiroyuki](#) on Fri, 19 Oct 2007 09:34:52 GMT  
[View Forum Message](#) <> [Reply to Message](#)

---

cgroup's resource has "failure" counter. But I think memory cgroup  
has 2 types of failure

- failure of cache
- failure of RSS

This patch adds above 2 information to stat file.  
Above information is shown in "byte". But I wonder showing just counter  
is better or not...rather than PAGE\_SIZE.

Subject: [RFC][PATCH] memory cgroup enhancements updated [8/10] add pre\_destroy handler

Posted by [KAMEZAWA Hiroyuki](#) on Fri, 19 Oct 2007 09:35:44 GMT

[View Forum Message](#) <> [Reply to Message](#)

---

My main purpose of this patch is for memory controller..

This patch adds a handler "pre\_destroy" to cgroup\_subsys.

It is called before cgroup\_rmdir() checks all subsys's refcnt.

I think this is useful for subsyses which have some extra refs even if there are no tasks in cgroup.

Subject: [RFC][PATCH] memory cgroup enhancements updated [10/10] NUMA aware account

Posted by [KAMEZAWA Hiroyuki](#) on Fri, 19 Oct 2007 09:37:30 GMT

[View Forum Message](#) <> [Reply to Message](#)

---

This patch is a trial for making stat for memory\_cgroup NUMA-aware.

- \* dividing per-cpu stat to handle nid information.
- \* add nid information to page\_cgroup
- \* Because init routine has to call kmallocc, init\_early is set to be 0.

This is just a trial at this stage. Any comments are welcome.

Works well on my fake NUMA system.

I think we can add "numastat" based on this.

Why do you think these are significantly different? Also, what kind of failure do we get when a task tries to fault on a mapping for a file-backed VMA? That's both RSS (since it's due to be mapped into the process' memory) and pagecache (assuming a cache-backed filesystem).

Paul

One is for checking how memory cgroup works.  
When memory reaches limit and amount of CACHE doesn't change but  
CACHE.failure increases, maybe CACHE is rotating.

One is for debug, I'd like to check swapiness <-> RSS.failure:CACHE.failure  
relationship. It's ok to turn these params to be DEBUG option.

File-backed VMA gets RSS.failure.

Thanks,  
-Kame

But with this change, we'll start reclaim on the node that the task  
hit the limit on - right?

yes.  
I wonder it can be changed if we have precise information and some logic.  
But no concrete idea of better logic now.

```

Could we define

```

enum {
    MEM_CGROUP_CHARGE_TYPE_CACHE = 0,
    MEM_CGROUP_CHARGE_TYPE_MAPPED = 1,
};

```

and use the enums here and below.

```

Do we need to use the vmalloc() pool? I think we might be better off using a dedicated slab for ourselves

```

I don't understand why this change is required here?

```

I think keeping "we can destroy cgroup only when refcnt=0" semantics is better.

Thanks,

If early\_init = 1, we cannot call kcalloc/vmalloc at initializing init\_mem\_cgroup.  
It's too early.

Thanks,
