Subject: *SOLVED* fstab mount

Will / Should an VE read and mount shares out of fstab?

I've resolved all the NFS funnyness and I'm able to "mount -t nfs ..." my shares but entries in fstab seem to be ignored on startup.

I can resolve this quickly just by issuing the mount command in an init script but if fstab should be read I'd like to fix the issue. Any input?

This is a Centos5_64 VE on a Centos5_64 host.

I've resolved all the NFS funnyness and I'm able to "mount -t nfs ..." my shares but entries in fstab seem to be ignored on startup.

I have NFS mounts in /etc/fstab and they work fine. This is a CentOS 4 VE on a Redhat EL 4 host.

mount arguments: nfs hard,intr,nosuid,actimeo=1

Ugh, that's the problem with trying to build your VE templates as light as possible.... you miss things. /etc/init.d/netfs wasn't starting
