Hello,

I created an image with debian etch and plesk 8.2.1. When I want to use this image as an osteamplate, I get the following error:

```
tar: ./etc/alternatives/javac.1.gz: Cannot create symlink to
`/usr/share/man/man1/javac.j2se14.1.gz': Disk quota exceeded
```

There are some more errors with "disk quota exceeded", when I create a new VPS with this osteamplate.

How can I solve the problem, because the harddisk has enough space.

Thank you very much,

Tony

in VE:

```
df -i
```

```
df -h
```

```
cat /proc/user_beancounters
```

```
wc -l /etc/passwd
```

```
wc -l /etc/group
```

from HN:

```
grep -i ugid /etc/sysconfig/vz-scripts/<VEID>.conf
```

```
df -h
```

```
df -i
```

Send us that stuff and the problem should be apparent
