Subject: [patch 1/1][NETNS] resend: fix net released by rcu callback Posted by Daniel Lezcano on Tue, 30 Oct 2007 16:21:40 GMT View Forum Message <> Reply to Message

When a network namespace reference is held by a network subsystem, and when this reference is decremented in a rcu update callback, we must ensure that there is no more outstanding rcu update before trying to free the network namespace.

In the normal case, the rcu\_barrier is called when the network namespace is exiting in the cleanup\_net function.

But when a network namespace creation fails, and the subsystems are undone (like the cleanup), the rcu\_barrier is missing.

This patch adds the missing rcu\_barrier.

Looks sane. Did you have any specific failures related to this or was this something that was just caught in review?

Eric

Yes, I had this problem when doing ipv6 isolation for netns49. The ipv6

subsystem creation failed and the different subsystem where rollbacked in the setup\_net function. When the network namespace was about to be freed in free\_net function, I had the error with an usage refcount different from zero. It appears that was coming from core/neighbour.c

neigh\_parms\_release
-> neigh\_rcu\_free\_parms
-> neigh\_parms\_put
-> neigh\_parms\_destroy
-> release\_net

The free\_net function was called before rcu callback neigh\_rcu\_free\_parms.

Ok. Cool. It is good to know that this patch was tested. These kinds of subtle fixes are always more solid when you can actually test them.

Applied, thanks Daniel.
