
Subject: [RFC][PATCH 0/5] uts namespaces: Introduction

Posted by [serue](#) on Fri, 07 Apr 2006 18:36:00 GMT

[View Forum Message](#) <> [Reply to Message](#)

Introduce utsname namespaces. Instead of a single `system_utsname` containing hostname domainname etc, a process can request it's copy of the uts info to be cloned. The data will be copied from it's original, but any further changes will not be seen by processes which are not it's children, and vice versa.

This is useful, for instance, for `vserver/openvz`, which can now clone a new uts namespace for each new virtual server.

This patchset is based on Kirill Korotaev's Mar 24 submission, taking comments (in particular from James Morris and Eric Biederman) into account.

Some performance results are attached. I was mainly curious whether it would be worth putting the `task_struct->uts_ns` pointer inside a `#ifdef CONFIG_UTS_NS`. The result show that leaving it in when `CONFIG_UTS_NS=n` has negligible performance impact, so that is the approach this patch takes.

-serge

Performance testing was done on a 2-cpu hyperthreaded x86 box with 16G ram. The following tests were run:
dbench (20 times, four clients, on reiser fs non-isolated partition)
tbench (20 times, 5 connections)
kernbench (20 times)
reaim (20 times ranging from 1 to 15 users)

They were run on 2.6.17-rc1:
pristine
patched, but with `!CONFIG_UTS_NS` ("disabled")
patched with `CONFIG_UTS_NS=y` ("enabled")

All results are presented as means +/- 95% confidence interval.

Dbench results:

pristine: 387.080727 +/- 9.344585
patched disabled: 389.524364 +/- 9.574921
patched enabled: 370.155600 +/- 30.127808

Tbench results:

pristine: 388.940100 +/- 18.095104
patched disabled: 389.173700 +/- 23.658035
patched enabled: 394.333200 +/- 25.813393

Kernbench results:

Subject: [RFC][PATCH 1/5] uts namespaces: Implement utsname namespaces
Posted by [serue](#) on Fri, 07 Apr 2006 18:36:00 GMT
[View Forum Message](#) <> [Reply to Message](#)

This patch defines the uts namespace and some manipulators.
Adds the uts namespace to task_struct, and initializes a
system-wide init namespace which will continue to be used when

it makes sense.

Subject: [RFC][PATCH 5/5] uts namespaces: Enable UTS namespaces debugging
 Posted by [serue](#) on Fri, 07 Apr 2006 18:36:00 GMT

[View Forum Message](#) <> [Reply to Message](#)

Adds a /uts directory in debugfs which exposes the current UTS namespace. If a file in this directory is changed, it will unshare and modify the UTS namespace of the current process.

Clearly this is purely for testing purposes. Testing namespaces in this fashion allows us to postpone consensus on a namespace unsharing mechanism.

Subject: [RFC][PATCH 2/5] uts namespaces: Switch to using uts namespaces
 Posted by [serue](#) on Fri, 07 Apr 2006 18:36:00 GMT
[View Forum Message](#) <> [Reply to Message](#)

Replace references to system_utsname to the per-process uts namespace where appropriate. This includes things like uname.

Subject: [RFC][PATCH 3/5] uts namespaces: Use init uts_namespace when appropriate

Posted by [serue](#) on Fri, 07 Apr 2006 18:36:00 GMT

[View Forum Message](#) <> [Reply to Message](#)

In some places, particularly drivers and __init code, the init uts namespace is the appropriate one to use. This patch replaces those with a direct reference to init_uts_ns.name. Note that we can drop this patch and simply do #define system_utsname (init_uts_ns.name) however by using this patch we make explicit, for the sake of review, those places where we do and do not use the utsname namespace.

Signed-off-by: Serge E. Hallyn <serue@us.ibm.com>

```

Ok. This looks like the best version so far.

I like the `utsname()` function thing to shorten the idiom of `current->uts_ns->name`.

We probably want to introduce `utsname()` and an `init_utsname()` before any of the other changes, and then perform the substitutions, before we actually change the code so the patchset can make it through a `git-bisect`. This will also allow for something that can be put in `compat-mac.h` for backports of anything that cares.

It also kills `system_utsname` so you left the kernel uncompileable.
Can you kill it later?

```
> diff --git a/include/linux/utsname.h b/include/linux/utsname.h

You can kill this include
> +#include <linux/sched.h>
```

if you move this static inline to `sched.h`

```
+
> +static inline struct new_utsname *utsname(void)
> +{
> + return &current->uts_ns->name;
> +}
```

And since it operates on `¤t` that may make sense.

If you define helpers that operates on system_utsname and then apply
this patch the kernel will still compile, and only later you can
introduce the new stuff.

I can insert a #define system_utsname (init_uts_ns.name) in patch 1
and nuke it at patch 3.

Ok, will try structuring the patches that way.

thanks,

This is the same as what Sam is saying, right? Just making sure I understand.

> before we actually change the code so the patchset can make it
> through a git-bisect. This will also allows for something

Ok, I've finally got the rest of git doing my bidding, I'll go read up on git-bisect.

thanks for the comments,
-serge

Basically git-bisect is an automated binary search through patches to help find bugs. If you ever can't compile at an intermediate patch git-bisect and other people walking through the patches

looking for bugs won't like it.

It's not mandatory that you never break anything in a patchset, but it is much friendlier when you can avoid breakage.

Eric

```

I had it there originally. Don't mind moving it back if that seems more appropriate, but of course then we'll need to `#include <linux/utsname.h>` in `sched.h`, since we need to know struct `uts_ns` to get `uts_ns->name`.

So is moving it to `sched.h` the way to go?

thanks,
-serge

Why not EXPORT_SYMBOL_GPL?

What do you expect the user api to look like, a syscall?

Probably need to think about LSM hooks for creating and updating the namespaces.

Actually come to think of it they don't need to be exported.

I will move the exports to the last, debugging, patch.

> What do you expect the user api to look like, a syscall?

This remains to be determined, and this patchset purposely doesn't address it. AFAIU, the two most likely options are extending clone and unshare, and using new syscalls. Whatever is decided for the other namespaces, this should use.

With this patchset (minus the last patch for debugging) uts namespaces are supported, but processes can't clone their uts namespace yet.

> Probably need to think about LSM hooks for creating and updating the
> namespaces.

True, that is something that needs to be discussed when the topic of how to implement unsharing comes up again.

thanks,
-serge

Serge,

BTW, have you noticed that NFS is using utsname for internal processes and in general case this makes NFS ns to be coupled with uts ns?

Serge, your testing approach looks really strange for me.

First of all, you selected the worst namespace to check performance overhead on.

1) uts_ns is rarely used and never used on hot paths,
2) also all these test suites below doesn't test the code paths you modified.

So I wonder what was the goal of these tests, especially dbench?!

Thanks,
Kirill

Either that, or each NFS vfsmount has a uts_ns pointer.

Sam.
