
Subject: need 2.6.19+ kernel in debian

My new server uses a 3ware 9650 controller which is supported natively in 2.6.19+ kernels, but Etch only shows me the 2.18openvz kernels.

When I install the openvz-enterprise kernel from apt, the disk array is no longer recognized (and the machine can't boot).

How can I get a newer openvz kernel working in debian? Am I stuck with Fedora?

If you feel comfortable running on the test branch of the openvz patches, you may try this:
http://wiki.openvz.org/Download_kernel_2.6.22/Archives/ovz00_3.2

there is a patch for 2.6.22 vanilla kernel available - you may download it and build your custom kernel with help of this article:
http://wiki.openvz.org/Kernel_build

I am running on 2.6.22 with this patch and it looks stable for me.

This worked beautifully, thank you!

I spoke too soon. The kernel compiles and vzctl works, but none of my VE's can see the outside world. Packets are not being forwarded.

After checking on the HW node, it turns out that IPTables is not installed in the kernel. Looks like that openvz config file for 2.6.22 is wrong.

How can I get my VE's to see the outside world?

Well, basically, you do not need iptables to get packets forwarded. Have you checked if ip_forward is enabled?
As for the iptables issue - you probably need just to recompile your kernel with firewall enabled.

Hi,

it's easy the build the 3ware-9xxx driver for Debian on 2.6.18 :

1) go to 3ware website (-> <http://www.3ware.com/support/download.asp>)
Select:

- > 3ware card 9560 SE
- > 3ware 9560 SE 2LP ...
- > Driver
- > Linux 2.6. source
- > next
- > 3w-9xxx-2.6.18kernel-9.4.2.tgz, fetch it and unpack it and change dir to drivers of 3ware tar-gz

2) Download the linux-headers for your kernel
aptitude install <linux-header_for_your_running_kernel>

3) build module
ln -s /usr/src/linux-headers-<downloaded_kernel-headers> /usr/src/linux

make

You will find your module "3w-9xxx.ko" in the directory.

What do I do after I have the .ko driver file? How do I add that to a kernel?

ip_forward was enabled but it still didn't work. Enabling firewall in the conf didn't help either. I need iptables to monitor bandwidth so its important.

I dropped down to a 2.6.20 kernel, applied patches and config and compiled/installed. Everything now works ok.

What is wrong with this kernel (2.6.20 ?). Anything I should watch out for? I see that development on it has been stopped and only 2.6.22 is being worked on.
