Good morning

I've got a plesk installation on a openvz as the single VeID in the machine (vzsplit -n 1).
The box has 3.5 Gb of memory, and is a 2000GHz Dual Core.
For around of 200 domains the machine should be fine i guess.
But, all the time we are being left with no memory.
Almost every day privvmpages break the counter in user_beancounters.
And after restarting apache2 everything goes fine.

It's a problem with plesk eating all the memory, apache2-mpm-prefork,
openvz memory management or what?

Thanks in advance

Probably PHP.

Well, 3.5Gb should be a fair amount of memory for that amount of domains as I experienced with physical machines.
I would like to know what approaches have taken the people experiecing similar issues...

Limit MaxClients, MinSpareServers, MaxSpareServers and most importantly
MaxRequestsPerChild. This way PHP will not have much time to leak too
much memory, which should keep the usage down a bit.

I tuned the following Timeout, MaxKeepAliveRequests, KeepAliveTimeout.
And also the ones that you've told, specially MaxClients and
MaxRequestsPerChild which seem to be the most important ones.

Will see how it goes for the next days!

Cheers

Too bad, nothing changes, memory keeps increasing everytime until
everything crashes silently, thanks to the alarms everytime it happens
I can reboot the services, but it's not normal...
Tomorrow I'll compare the parameters (ps, lsof, netsat) in the critical
moments with the ones in normal time and see.

Cheers

Ok, finally got time to check

After some time of restarting the whole VeID lsof brings me some
information:

lsof | wc -l -> Has a value of 8560

In the moment where it has almost no memory:
wc -l lsof_with_problems -> The value is 30006

Analyzing the file a bit further I can see that out of 30006 open files, the owner of 28266 is apache2

I would guess that somehow apache is not closing the files, either for memory problems with openvz, or maybe because the non-threading configuration that can slowdown the apache process.

Any clue?

Shall I go to ask to apache mailing list? Or could it somehow be related to openVZ?

Nope, it looks purely like apache problem.

You can also check the following:

- what are these files? ls -la /proc/pid/fds
i.e. it can be sockets or files. what are they?
`netstat -natp` output can be helpful as well
 - plz post /proc/user_beancounters output.
it always helps to analyze the resource shortage problems.
 - what does apache say in the log when problem begin?
- you can also ask Plesk support if issue is related to Plesk product.

Thanks,
Kirill
