Hi, guys!

We have uploaded the git repo at [git.openvz.org](http://git.openvz.org):  
<http://git.openvz.org/?p=linux-2.6-netns;a=summary>

You may setup a remote repo on it and fetch it from time to time.  
git daemon seems to work on it :) so fetch commits via git protocol.

I will try not to forget to inform everybody who is interested in it about major events (rebase/new subsystems). If the development will be very active, I think it would make sense to setup a separate mailing list for it.

There are 3 branches in it:

1. master - this is the Linus' tree. Most likely we'll not update it :);
2. net-2.6 - this is a David Miller's netdev tree. We are going to fetch it from time to time (I plan once a week at least) and rebase the netns patches on it;
3. net-2/6-netns - this is going to be our main development branch. Currently there are only unix and packet sockets virtualized. This is the part which looks complete by now. I hope that we'll manage to get IPv4 there next week.

Hope to see IPv6 patches from you soon. Happy hacking!

Thanks,  
Pavel
