Ok, I got it up now ^^
Thanks a lot..
But now I got the problem. How to continue?
After reading the Wiki I understand that I have to make a template.
but now I wonder. Can this also been done by just inserting the cd and installing the system with all the tools I want the user to have?? for example I want to use the Distro: AdminsParadise in one Virtual Box. And AsteriskNOW in another. So, well whats the best way to do this? Just to install and tar the entire system them to make it a Template?
Can I make a Virtual Harddrive (I noticed that OpenVZ doesnt really work as all the other Virtual Systems) and RAID-1 that with a Normal HD or a Example HD to Copy the entire HD so well I can just pre-install a system and Configure it how I want it? (eg I want to run in the Virtual Boxes a self made DE that has links to ssh servers that are all pre determined)

Thanks a lot already for reading.
If you can also help me Id be exhilirated..

Cheers,
Robin

Edit: Ok I got my first os up now. With the example.
I still need to make a template myself once and set the network settings right..

Edit:
Well, after looking along time at the Network,
I think I have to use iptables as a NAT?
So basically I'll run another network on my PC that is in a Server-Farm..??

Thanks.

(I love this product, its hard to get in but when you get the hang of it)
